Introduction

This methodology (the "Methodology") has been made available by Bloomberg Index Services Limited ("BISL") and sets out the rules, criteria, risk factors and other information application to the Bloomberg BFIX Benchmarks (the "Indices" and each, an "Index"). Capitalized terms used in this Methodology but not otherwise defined have the meanings set forth in Exhibit B (Glossary).

Objectives and Key Features

The Bloomberg BFIX rates aim to produce Spot, Forward and Non-Deliverable Forward ("NDF") FX rate fixings for certain currencies and Metals, detailed in Exhibit A to this methodology.

Using Bloomberg LP's (Bloomberg L.P. and collectively with its affiliates "Bloomberg") data, technology, and distribution platforms, BFIX is made available with the objective of providing FX fixings that are reliable, representative, and transparent for the currency and Metals markets around the world.

The benchmark offers an unbiased source of FX data for use by market participants who need to use in, among other things, portfolio benchmarking, derivatives valuation, index construction and trade execution.

- Calculated and published every 30 minutes throughout the day when markets are open.
- Operates from 5.30pm on Sunday EST to 5pm Friday EST (see Section 3 for further details of publication hours and local market hours).
- Produces over 5,200 fixings covering over 140 core currencies against the United States Dollar, (USD), 1,170 Spot cross pairs and over 3,900 Forward and NDF fixings.
- Rates are published on the Bloomberg terminal to a dedicated screen BFIX <GO> within 15 seconds of the end of the fix for USD based Spots & Forwards and within 1 minute for others.
- BFIX can be consumed in many Bloomberg analytics and APIs and is also available via the Enterprise Data suite of services for commercial application of the benchmark. To inquire about data licenses or other questions, please contact bfixinquiry@bloomberg.net

Compliance and regulatory certifications:

- UK BMR compliant benchmark
- Administered by BISL
- BISL is authorized as a Benchmark Administrator by the U.K.'s Financial Conduct Authority (FCA)
- Designed in alignment with the International Organization of Securities Commissions (IOSCO) Principles for Financial Benchmarks

Section 1: Input Data

BFIX rates are based on pricing provided by the Bloomberg Executable Rates (“BGNE”) and Bloomberg Generic Price (“BGN”) sources.

Classification of Pricing

- Spot USD currency pairs employed by BGNE are from purely executable pricing.
- All other data is from BGN which is a blend of executable and/or indicative pricing.
- BFIX prices several currencies that utilize a peg system and may be driven by the associated peg of that country. BFIX also has several legacy EURO currencies. Pegs and EURO legacy currencies are listed in Exhibit A.

BGNE (Bloomberg Executable rates)

The BGNE pricing source is a real-time pricing composite based purely on executable data feeds from Bloomberg's FXGO trading platform. They are received from a diverse universe of sources who provide them for the primary purpose of soliciting actual FX transactions from the market. BGNE is computed as the median average bid/offer and currently is available for Spot currency pairings only.

The following Spot USD currency pairs employ the BGNE source for pricing. Any crosses of the below will be driven by executable pricing from the underlying USD currency pair.

	Name	Currency pair
1	Australian Dollar	AUDUSD
2	British Pound	GBPUSD
3	Canadian Dollar	USDCAD
4	Chinese R. Yuan HK	USDCNH
5	Czech Koruna	USDCZK
6	Danish Krone	USDDKK
7	Euro	EURUSD
8	Hong Kong Dollar	USDHKD
9	Hungarian Forint	USDHUF
10	Indian Rupee	USDINR
11	Israeli Shekel	USDILS
12	Japanese Yen	USDJPY
13	Mexican Peso	USDMXN
14	New Zealand Dollar	NZDUSD
15	Norwegian Krone	USDNOK
16	Polish Zloty	USDPLN
17	Romanian Leu	USDRON
18	Singapore Dollar	USDSGD
19	South African Rand	USDZAR
20	Swedish Krona	USDSEK
21	Swiss Franc	USDCHF
22	Thai Baht	USDTHB
23	Turkish New Lira	USDTRY

BGN (Bloomberg Generic Price)

BGN prices are designed to show market-consensus bid and ask rates from a select subset of Bloomberg's FX price sources, which have met selection criteria such as pricing consistency, frequency, and quality. BGN has extensive coverage across Spot and Forwards and includes executable pricing as well as indicative where markets are less liquid.

Section 2: Calculation**Equally Weighted Average Price**

A BFIX rate is calculated by taking an equally weighted average price of BGNE or BGN bid and ask prices. This is applied using an equal weight for each time slice of the fixing window.

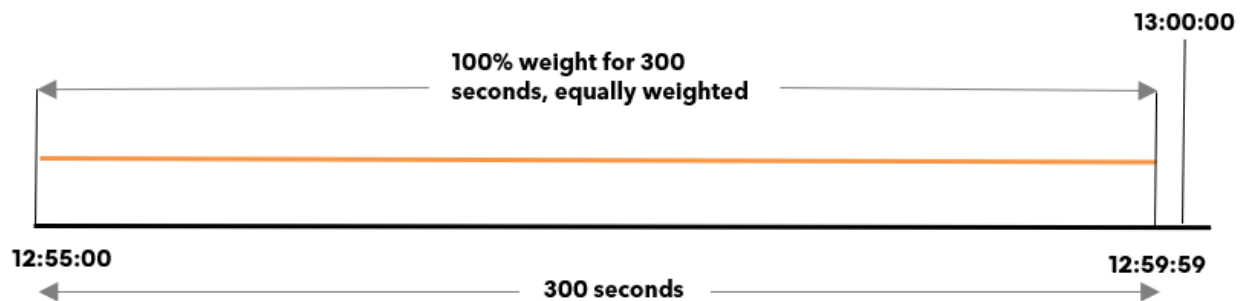

Each time slice of the fixing window is one second long. The BGNE and BGN can produce multiple prices within one second for a currency pair of which the arithmetic average is taken to produce one BGNE or BGN price for each second to be used in the BFIX window.

BFIX Window

The time frame for the window for all Spot currencies, Swap points, Outrights and Metals will be three hundred seconds (five minutes).

- The first time slice commences at exactly five minutes and zero seconds before the BFIX time.
- The last time slice ends at one second prior to the BFIX time.

For example, a BFIX 1pm will commence the first time slice at 12:55:00 and conclude at 12:59:59.

Illustrative example of Spot BFIX**Formula**

The following is the formula to calculate the BFIX price:

$$BFIX = \frac{\sum(P_s * W_s)}{\sum W}$$

P_s = Average price in a second

W_s = Weight of second (each second is equally weighted)

W = Weights with an available price

Rounding

Market convention, as represented by the history of source inputs, dictates the number of decimal places used in a fixing. When the application of algorithms produces an additional decimal place for the bid and/or ask, BFIX will round that number up or down as warranted.

To help ensure a measurable bid/ask spread, the bid is always rounded down, and the ask is always rounded up. For example, a bid/ask calculation of 1.10919 / 1.10921 will be rounded to 1.1091 / 1.1093 with a mid of 1.1092.

This rounding approach applies to Spot FX, Metals, and NDF Outrights but does not apply to Latam NDFs or on Forwards, where standard arithmetic rounding applies.

Cross Calculation

All BFIX calculations are determined solely from currencies are quoted against the USD. Any other currency pair is thus cross calculated via the USD BFIX rates. This cross calculation is performed using the final BFIX rates themselves and not during the BFIX calculation window. For example, a EURJPY BFIX Spot rate will be crossed using the EURUSD BFIX rate and the USDJPY BFIX rate and not using direct EURJPY pricing. This is to avoid the issue of arbitrage triangulation.

Date Alignment

A significant benefit to BFIX is the adoption of accurate market settlement date alignment which factors in local market holidays. BFIX will adhere to the market settlement date of the currency pair daily.

All currencies settle T+2-day settlement against the USD with the following exceptions:

Settlement	
T+0	MNT (Mongolian Togrog), MDL (Moldova Leu), KGS (Kyrgyzstan Som), AZN (Azerbaijan Manat)
T+0	UAH (Ukraine Hryvnia)
T+1	CAD, KZT, PHP, TRY settle T+1 against USD, against each other, and against any currency settling T+0 against USD (see first two bullet points above).
T+1	RUB settles T+1 against all currencies except DKK, SEK, and NOK, against which RUB settles T+2.
Crosses	All other non-USD currency pairs settle on the later of the Spot settlement dates for each of the two currencies against USD.

When cross calculating a T+2 currency and a T+1 currency BFIX will adjust the T+1 pair up to T+2 by BFIX Tom/Next (T/N) Points. If the T/N Points are not available BFIX interpolates between the Spot and the next available tenor. If there are no forward tenors available on a currency, BFIX will not date align.

Weekends and Market Holidays:

BFIX also will adjust the standard market settlement for a currency pair when market holidays are observed and reflect the standard market settlement date for the currency pair as traded in the global Spot foreign exchange market.

- When counting forward from a given pricing date to determine the corresponding T+2, T+1, or T+0 Spot date, weekends are ignored (so, effectively Monday immediately follows Friday).
- If the Spot date (i.e., 'T') would fall on a public holiday, then the Spot date (i.e., 'T') will be the first following day that is a business in all respected calendars.
- When counting forward to determine a T+2 settlement date, any day that is a holiday in any respected calendar other than the Fed calendar is ignored just as a weekend day is ignored.
- When counting forward to determine a T+2 settlement date for a currency against USD, any day that is a Fed holiday but not a holiday in any other respected calendar is applied toward the settlement date calculation (unless Spot itself would fall on the holiday in which case see above).

Exceptions to the above treatment:

- USDMXN and USDBRL, where a Fed holiday is treated the same way a holiday in any other calendar is treated.
- USDILS, where if the first business day after the pricing date is a holiday in the ILS calendar but not a holiday in the Fed calendar, then that day is applied toward the settlement date calculation in the same way that it would be applied were it a holiday in the Fed calendar instead.

Weekend Handling for the Middle East:

- For SAR, KWD, and AED, Saturday and Sunday are treated as non-business days.
- For Thursday pricing dates, SAR settles the following Tuesday against any other currency. For SAR Thursday is treated as a business day unless it is a holiday.
- For Friday pricing dates, SAR, KWD, AED, BHD, JOD, OMR, and QAR settle the following Tuesday against any other currency.

Forwards

For currencies that are classed as deliverable, the BFIX will use Swap points as the source of liquidity and the Outrights will be derived.

For example, USDCAD (Canadian Dollar) 1-month:

$$BFIX\ Spot + BFIX\ Points = BFIX\ Outright$$

For Non-Deliverable Forward (NDF) defined currencies BFIX will use the outright market as the source of liquidity. Therefore, the BFIX Swap points will be derived.

For example, USDKRW (Korean Won) 1-month BFIX NDF:

$$BFIX\ Outright - BFIX\ Spot = BFIX\ Points$$

The exception is Latam NDFs where Swap points are the source of liquidity and BFIX will derive the Outrights.

Active Market

An active market is one where at least one bid and one ask price from the relevant pricing source is received during the fixing window.

Unless predefined as a peg currency (see Exhibit A), BGN and BGNE will not be determined based on a single source. If no BGN or BGNE price can be produced within a fixing window, the previous BFIX will be carried forward.

In no event will BGN or BGNE produce a price, or BFIX produce a fixing, which can be reverse engineered to an input data source.

Carry Forward

Where BISL determines that an active market does not occur in a BFIX Spot, Forward or Metals fixing window, then the BFIX will take the previous BFIX and publish that until the market becomes active again.

When local markets are closed the Spot price is carried forward. However, the NDF market remains active. The BFIX will thus allow the NDF pricing to remain active but carry forward the derived points or Outrights until the local Spot market opens again.

For example, USDKRW (Korean won) 1-month BFIX NDF. The Spot and BFIX Swap points will carry forward from the local market close, but the BFIX NDF Outright will take live liquidity. Once the local market opens again the Spot is allowed to access live liquidity and the points are derived as above.

Section 3: Publication

BFIX Coverage

BFIX operates 24 hours a day throughout the year in line with the following market hours and subject to local currency hours policy and national holidays policy below:

- First BFIX of each week will be Sunday 5:30pm New York time.
- Last BFIX of each week will be Friday 5pm New York time.

BFIX will be produced every 30 minutes on the hour and half-hour, subject to the policy on national holidays below.

Policy on National Holidays, Local FX Market Closure, and other Inactive Market Periods

The FX market is a global 24 hours a day market. A public holiday in a country does not necessarily mean the FX market is closed.

BFIX will not publish on the following days where liquidity is known to be significantly impacted: Easter Friday, Christmas Day, and New Year's Day. Exhibit C lists the dates of these public holidays over the next five years. When the local market is closed, BFIX publishes by carrying forward the prior BFIX.

At other times when FX markets are inactive, and a BGN or BGNE, as relevant, is not available, BFIX publishes by carrying forward the prior BFIX.

Hours of Local Currencies

There are some currencies where offshore trading does not occur or is not permitted by that country. For these currencies, BFIX will be published when the local market is open, and when closed, carry forward the closing price until the market opens again. This impacts the following currencies, updated from time to time, with all open and close times in local market hours.

Country	ISO	Open	Close	Country	ISO	Open	Close
Argentine Peso	ARS	10:00am	3:00pm	Malaysian Ringgit	MYR	8:00am	6:00pm
Bahrain Dinar	BHD	9:00am	1:30pm	Omani Rial	OMR	8:00am	2:00pm
Brazilian Real	BRL	9:00am	6:00pm	Pakistani Rupee	PKR	9:30am	5:30pm
Chilean Peso	CLP	8:30am	4:00pm	Peru New Sol	PEN	9:00am	1:30pm
China Renminbi	CNY	9.30am	3.00am	Philippine Peso	PHP	9:00am	4:00pm
Colombian Peso	COP	8:00am	1:00pm	Qatar Rial	QAR	8:00am	1:30pm
Egyptian Pound	EGP	8:30am	2:30pm	Saudi Arabian Riyal	SAR	9:00am	5:00pm
Indian Rupee	INR	9.00am	3:30pm	South Korean Won	KRW	9:00am	3:30pm
Indonesian Rupiah	IDR	9:00am	3:00pm	Taiwan Dollar	TWD	9:00am	4:00pm
Israeli Shekel	ILS	8:00am	11:00pm	UAE Dirham	AED	9:00am	3:00pm
Kenyan Shilling	KES	8:00am	6:00pm	Uruguay Peso	UYU	9:00am	3:00pm
Kuwaiti Dinar	KWD	8:00am	2:00pm				

Delivery Methods

Absent a disruption or failure, BFIX will be published on the Bloomberg Professional service within 15 seconds of the fixing time for USD based Spots & Forwards and within 1 minute for all others. The rates can be consumed in many Bloomberg functions and via APIs.

A select number of currencies and times for the Spot price only will be available on the Bloomberg website under a delay of 25 minutes. <https://www.bloomberg.com/professional/product/indices/bfix/>.

Those select currencies and times are listed in Exhibit D.

Section 4: Benchmark Oversight & Governance

Please refer to the BISL Benchmark Procedures Handbook available [here](#)¹ for the following:

- Governance Structure
- Benchmark and Methodology Changes
- Expert Judgement and Discretion
- Conflicts of Interest
- Restatement Policy
- Cessation Policy

Section 5: Risks Associated with BFIX

The following is a summary of certain risks associated with BFIX but is not meant to be an exhaustive list of all risks associated with using BFIX, an investment in currencies or Metals, or investments measured against BFIX. Though the fixings are designed to be representative of the markets they measure, they may not be representative of every use case. There is also inherent, though transparent, judgment in their construction, as outlined in this methodology. They are also designed for general applicability and not to address the individual needs of users. Bloomberg does not advise as to the usefulness of BFIX to a particular circumstance, and users are therefore encouraged to seek their own counsel for such matters.

This methodology is subject to change, which may impact its usefulness to users. Though efforts will be made to alert users of this change, not every individual user may be aware of them. Such changes may also significantly impact the usefulness of BFIX.

Bloomberg may also determine to cease publication of BFIX or a particular fixing provided by BFIX. Bloomberg maintains internal policies regarding user transitions, but there is no guarantee an adequate alternative is available generally or for a particular use case.

Markets for currencies and Metals, as with all markets, can be volatile. As BFIX is designed to measure those markets, its fixings could be materially impacted by market movements, thus significantly impacting the use or usefulness of the fixings for some or all users. Also, certain currency and Metals markets are less liquid than others, and even the most liquid markets may suffer periods of illiquidity. Illiquidity can have an impact on the quality or amount of data available to BFIX for calculation and may cause BFIX to produce unpredictable results.

BFIX is based on executable and indicative bid and ask rates which are supplied by source institutions in their discretion. While they reflect where those institutions would be willing to transact, they may not be reflective of where they transacted.

Also, while BFIX will not accept pricing from BGN that is derived from a single source, (unless predefined as a peg currency), the number of source rates with respect to a particular fixing may be relatively few at any given snapshot. However, in no event will BGN produce a price, or BFIX produce a fixing, which can be reverse engineered to an input data source.

¹ <https://assets.bbhub.io/professional/sites/27/BISL-Benchmark-Procedures-Handbook.pdf>

Section 6: Limitations of BFIX

Though the benchmarks are designed to be representative of the markets they measure or otherwise align with their stated objective, they may not be representative in every case or achieve their stated objective in all instances. They are designed and calculated strictly to follow the rules of this methodology, and any fixing Level or other output is limited in its usefulness to such design and calculation.

Markets for currencies, as with all markets, can be volatile, including those market interests which the benchmarks intend to measure or upon which the benchmarks are dependent in order to achieve their stated objective. For example, certain currency markets are less liquid than others, and even the most liquid markets may suffer periods of illiquidity. Illiquidity can have an impact on the quality or amount of data available to BFIX for calculation and may cause BFIX benchmarks to produce unpredictable results.

In addition, market trends and changes to market structure may render the objective of the benchmarks unachievable or to become impractical to replicate by investors. As BFIX benchmarks are designed to measure those markets, its benchmarks could be materially impacted by market movements, thus significantly impacting the use or usefulness of the fixings for some or all users.

Exhibit B: Glossary

Active market

An active market is one in which Bloomberg has received at least one bid and ask price in the fixing window.

Ask

The rate at which a market maker is willing to sell the base currency or metal. Also known as an offer.

Bid

The price at which the market maker is willing to buy the base currency or metal.

Bloomberg Executable Rates (BGNE)

A representative price based on executable data feeds from Bloomberg's FXGO trading platform, published by Bloomberg L.P.

Bloomberg Generic Price (BGN)

A representative price based on executable and indicative rates sourced from participants in the applicable market, published by Bloomberg L.P.

Executable

As opposed to an indicative quote, an executable quote could be dealt on.

Forward

The foreign exchange rate on a date in the future.

FX

Foreign Exchange

G10 currencies

AUD, CAD, CHF, DKK, EUR, GBP, JPY, NOK, NZD, and SEK.

Indicative

A market maker's provided quote indicating where it would be willing to transact but is not obliged to transact at the price. Also known as 'not firm'.

Market maker

A firm or trader that is making a bid and an ask price to the market to trade on and take on the risk associated with the trade.

NDF

Means 'Non-deliverable Forward', which are contracts that involve no exchange of principal, are fixed at a pre-determined price, and are typically settled in USD (or sometimes, in the case of Eastern Europe, in EUR) at the prevailing Spot exchange rate taken from an agreed source, at an agreed time, on an agreed future date.

Outrights

A forward that locks in the price at which a currency can be bought or sold on a future date. Also known as 'Forward Outright'. Also appears as 'FX Outrights'.

Spot or Spot rate

The foreign exchange rate on the settlement date.

Swap points

The annualized percentage premium or discount that the forward outright (all-in rate) represents over the current Spot rate.

Exhibit C: Schedule of Days BFIX will not Operate

BFIX will not price on Good Friday.

BFIX will not price on Christmas Day or New Year's Day where such days fall on a Monday to Friday.

Where Christmas Day and New Year's Day fall on a Saturday, the U.S. National observed holiday will fall on the preceding Friday. However, on such days, the Fedwire remains open, FX markets will be open, and BFIX will price.

Where Christmas Day and New Year's Day fall on a Sunday, then the holiday is observed on the Monday. The Fedwire is closed and BFIX will not price.

As an example, in 2027, Christmas Day falls on a Saturday, and BFIX will price on the preceding Friday, December 24, 2027.

Days where BFIX will not be published are shown in the table below.

Date	Day	Holiday
2024		
January 1	Monday	New Year's Day
March 29	Friday	Good Friday
December 25	Wednesday	Christmas Day
